1.0 INTRODUCTION

1.0.0.1. This report presents the results of the verification of surface water, sediment pour water, and soil/groundwater investigative derived waste (IDW) data collected between October 2002 and October 2003 for the Bosque and Leon River Watersheds Study. The USACE Engineer Research and Development Center Environmental Laboratory at the Environmental Chemistry Branch in Omaha, Nebraska performed all sample analyses. The surface water, sediment pour water, and soil/groundwater IDW samples were analyzed for perchlorate by U.S. Environmental Protection Agency (U.S. EPA) method 314.0. Verification analysis of groundwater IDW samples by U.S. EPA method SW-846 8321A was performed by Severn Trent Laboratories, Inc. of Denver, Colorado.

1.0.0.2. The analytical results were evaluated against the project-specific data quality objectives (DQOs), which are quantitative and qualitative statements that specify data quality and are expressed in terms of the data quality indicators (DQI) of precision, bias and accuracy, representativeness, comparability, and completeness. This data evaluation is presented in terms of the DQI criteria and is based on the quality control limits established by the *Final Quality Assurance Project Plan (QAPP) for the Bosque and Leon River Watersheds Study, August 2002* (MWH, 2002), hereafter referred to as the QAPP. The analytical data were verified and qualified based on the results of the following data evaluation parameters or quality control (QC) samples:

- Laboratory compliance with laboratory standard operating procedures (SOPs) and the QAPP;
- Sample preservation and holding time criteria;
- Method and equipment rinseate blank sample results;
- Reporting limits (RL);
- Field duplicate sample results;
- Initial calibration (ICAL) and calibration verification standard (CVS) results;
- Matrix spike/matrix spike duplicate (MS/MSD) sample results;
- Laboratory control sample (LCS) results; and
- Laboratory duplicate (LD) sample results.

1.0.0.3. The following discussions focus primarily on how the data were verified, data that have significant associated QC problems (i.e., rejected data), and analytical method or QAPP deviations. Data qualified due to the data verification are presented in **Table 1**. Quality control parameters outside acceptance criteria that did not result in data qualification are presented in **Table 2**.

2.0 DATA VERIFICATION RESULTS

2.1 COMPLETENESS EVALUATION

2.1.0.1. Sampling Completeness. All samples were collected as scheduled, except when a sample collection location was dry or when the automatic sample collection equipment malfunctioned. Also, samples scheduled to be collected on October 16, 2003, could not be collected because the automatic sample collection equipment was destroyed by flooding shortly after October 1, 2003. With the exclusion of these three exceptions, sampling completeness for this project was 100 percent. The samples that could not be collected and individual comments explaining why the samples could not be collected are listed in the data summary tables included in the main body of the report.

2.1.0.2. Analytical Completeness. Analytical completeness was evaluated using the following equation:

$$\text{Completeness} = \frac{\text{Number of valid data points}}{\text{Total number of measurements}} \times 100$$

Where: The number of valid data points is the total number of valid analytical measurements based on the precision, bias, and holding time evaluation.

2.1.0.3. All scheduled samples were analyzed according to the QAPP. Based on the results of the data verification described in the following paragraphs, all data were considered valid as qualified, resulting in 100 percent analytical completeness for this project. The analytical results are presented in the data summary tables included in the main body of the report.

2.2 REPRESENTATIVENESS EVALUATION

2.2.0.1. Representativeness is a qualitative expression of the degree to which sample data accurately and precisely represent a characteristic of a population, a sampling point, or an environmental condition. Representativeness is maximized by ensuring that, for a given project, the number and location of sampling points, and the sample collection and analysis techniques are appropriate for the specific investigation; and, that the sampling and analysis program provides information that reflects "true" site conditions. Laboratory data were evaluated for representativeness by assessing the following:

- Laboratory compliance with laboratory standard operating procedures (SOPs) and the QAPP;

- Sample preservation and holding time criteria;
- Method and equipment rinseate blank sample results;
- RLs; and
- Field duplicate sample results.

2.2.1 SOP and QAPP Compliance Evaluation

2.2.1.1. Based on the data verification assessment, all samples were analyzed following the quality control criteria specified in the QAPP and were in accordance with the analytical methods and laboratory SOPs.

2.2.2 Sample Preservation and Holding Time Evaluation

2.2.2.1. Temperature blanks were included with each sample cooler for measurement upon receipt at the laboratory to assess whether the samples met the temperature requirement. The temperature criterion was met for all but 55 samples that were collected on the following dates: 02/27/03, 03/27/03, and 06/12/03. Because sample temperature does not affect data quality, no data were qualified. Samples associated with temperature blanks outside temperature requirements are listed in **Table 2** with “TEMP” as the QC type.

2.2.2.2. Holding time reflects the length of time after sample collection that a sample or extract remains representative of environmental conditions. The length of time between sample collection and sample analysis was evaluated. Sample holding times were compared to standard method specific holding times accepted by the U.S. EPA. Data for samples that were extracted and analyzed within holding time criteria were considered representative. For samples that were extracted or analyzed outside of holding time criteria, the sample data were qualitatively evaluated to determine the potential effect of the holding time exceedence on sample representativeness. The sample holding times for this project are listed in **Table 3**. Sample data that were qualified due to holding time exceedence are listed in **Table 1** with “HT” as the QC type.

2.2.3 Sample Blanks Evaluation

2.2.3.1. Equipment blanks and method blanks were used to assess representativeness for this project. Sample blanks were evaluated using the following procedures. If perchlorate was detected in a blank and in an associated sample, and the concentration of perchlorate in the sample was less than five times the concentration detected in the blank, perchlorate detected in the sample was qualified with a “UB” flag to indicate perchlorate is considered not detected. If the concentration of perchlorate in a sample was greater than five times the concentration detected in an associated blank, the sample datum was qualified with a “B” flag to indicate that a measurable concentration of perchlorate was detected in an associated blank.

2.2.3.2. Method Blank Samples. A method blank contains all the reagents used in the processing of samples and is carried through the complete analytical procedure used for the samples. The results of the method blank analyses are presented in **Table 4a** and **Table 4b**. No perchlorate was detected in the method blank samples.

2.2.3.3. Equipment Rinseate Blank Samples. Equipment rinseate blank samples were collected only for the Lake Belton Delta Area Study, Lake Waco Delta Area Study, and the Lake Belton Fate and Transport Study, by rinsing the sampling equipment with de-ionized water and collecting the rinseate in an appropriate sample container. The equipment rinseate blank samples were analyzed to assess the presence of possible carryover of perchlorate between environmental sample locations. The equipment rinseate blank sample results are presented in **Table 5**. No perchlorate was detected in the equipment rinseate blank samples.

2.2.4 Reporting Limit Evaluation

2.2.4.1. For this project, all sample data were reported to the RL established in the QAPP, with the following exceptions:

- All non-detect sample results were reported as less than the method detection limit (MDL).
- If perchlorate was detected between the MDL and RL, the result was qualified with a “J” flag to indicate the datum is estimated and reflects a value between the MDL and RL.

2.2.5 Field Duplicate Sample Evaluation

2.2.5.1. Field duplicate samples were collected and analyzed to evaluate sampling and analytical precision. Because precision is affected by several variables including sample heterogeneity, sample collection procedures, sample preparation and sample analysis, the results of field duplicates were used as additional evidence to support data quality rather than as a basis for accepting or rejecting the data.

2.2.5.2. The relative percent difference (RPD) was calculated only for those analytes that were detected above the MDL in both the environmental and field duplicate samples. The field duplicate data are presented in **Table 6**. Parent and field duplicate samples with an RPD greater than 20% or where perchlorate was detected in a field duplicate but not the parent sample, or vice versa, are listed in **Table 2** with “RPD” as the QC type.

2.2.6 Media Interference

2.2.6.1. Perchlorate concentrations could not be determined in the IDW samples because Liqui-Nox®, a commercially available detergent, was used to decontaminate the sampling equipment. Originally, very high concentrations of perchlorate were reported to be present in the IDW samples but not in the associated samples from which the IDW

samples were generated. Therefore, a sample of pure Liqui-Nox® was analyzed to determine if the sample peaks, originally attributed to perchlorate, were actually due to media interference caused by the Liqui-Nox®. The USACE laboratory determined that Liqui-Nox® elution overlaps the retention-time window of perchlorate causing media interference. Because perchlorate was not detected in the samples from which the IDW samples were generated, and the Liqui-Nox®-caused media interference, the USACE laboratory reported the perchlorate concentrations for the IDW samples as less than the MDL with a comment that perchlorate concentrations could not be accurately determined due to media interference.

2.2.6.1. To verify that the sample peaks, originally attributed to perchlorate, were actually due to media interference caused by the Liqui-Nox®, the groundwater IDW samples and a sample of pure Liqui-Nox® were submitted to Severn Trent Laboratories in Denver, Colorado, for analysis by liquid chromatograph/mass spectrometry/mass spectrometry (LC/MS/MS) method SW-846 8321A. This method was chosen to manage the interferences associated with Liqui-Nox® analysis. The LC/MS/MS analysis confirmed that the sample peaks, originally attributed to perchlorate, were in fact due to media interference caused by the Liqui-Nox®, and that the groundwater IDW samples contained no perchlorate above the MDL.

2.3 BIAS EVALUATION

2.3.0.1. Definition. Bias is a measure of the level of agreement between a measurement and a known true value. Bias is evaluated by percent recovery (%R), which is calculated using the following equation:

$$\%R = \frac{A - B}{C} \times 100$$

Where: A = The measured concentration of perchlorate in a spiked sample.

B = The measured concentration of perchlorate in an unspiked sample.

C = The concentration of perchlorate used for spiking.

2.3.0.2. Laboratory bias was evaluated using the results of ICAL and CVS results, MS/MSD sample results, and LCS sample results.

2.3.1 Initial and Continuing Calibration Evaluation

2.3.1.1. The ICAL and CVS were analyzed prior to and during sample analysis as specified by the analytical method. The ICAL is used to demonstrate linearity of instrument calibration and the CVS is used to assess whether the ICAL remains valid. The ICAL and CVS results were evaluated against the method specific QC criteria. If either the ICAL or CVS QC criteria were not met the data for all samples associated with the ICAL or CVS were qualified as follows:

- **ICAL Coefficient of Determination (r^2) Outside Acceptance Criteria.** If r^2 was outside the method respective acceptance criteria of > 0.990 , the sample data were qualified as follows. If perchlorate was not detected in the associated samples, the sample results were qualified with a “UJ” flag to indicate the data are estimated. If the corresponding analytes were detected in the associated samples, the sample results were qualified with a “J” flag to indicate the data are estimated.
- **CVS Percent Recoveries Outside Acceptance Criteria.** The percent recoveries of the spiked compounds were compared to the QAPP established QC limits. The same criteria used to evaluate the MS/MSD samples described below were used to evaluate the CVS, except that all data associated with the CVS were qualified.

2.3.1.2. All ICAL results were in control for all analyses. Several CVS results were outside the acceptance criterion. Sample data that were qualified due to CVS data outside acceptance criteria are listed in **Table 1** with “CVS” as the QC type. Calibration verification standard data outside acceptance criteria that did not result in qualified data

are presented in **Table 2** with “CVS” as the QC type.

2.3.2 Matrix Spike/Matrix Spike Duplicate Samples Evaluation

2.3.2.1. Site specific MS/MSD samples were analyzed to assess bias and to identify possible adverse matrix effects. These samples were spiked with perchlorate according to the QAPP before analysis. The percent recoveries of perchlorate were compared to the QAPP established QC limits. Matrix spike/matrix spike duplicate results are presented in **Table 7a** and **Table 7b**. The following criteria were used to evaluate the MS/MSD samples:

- **MS/MSD Recovery Below Acceptance Criteria.** Perchlorate recoveries below the acceptance criteria indicate a potential low bias during sample analysis. Therefore, if perchlorate was not detected in the parent sample, the sample datum was qualified with a “UJ” flag to indicate a possible false negative. If perchlorate was detected in the parent sample, the sample datum was qualified with a “J” flag to indicate the datum is estimated and potentially biased low.
- **MS/MSD Recovery Above Acceptance Criteria.** Perchlorate recoveries above the acceptance criteria indicate a potential high bias during sample analysis. Therefore, if perchlorate was not detected in the parent sample, the sample datum was not qualified because high recoveries indicate a high bias and do not affect non-detected analytes. If perchlorate was detected in the parent sample, the sample datum was qualified with a “J” flag indicating the datum is estimated and potentially biased high.
- **High Analyte Concentration in Parent Sample.** If the concentration in the parent sample was more than four times the spiked perchlorate concentration, the overall change in the MS/MSD concentration is not significant enough for the instrument to detect the spiked compound. Therefore, if the MS/MSD recoveries were outside the acceptance criteria, and the perchlorate concentration in the parent sample was more than four times the spiked perchlorate concentration, no data were qualified.
- **High and Low MS/MSD Exceedences.** Bias cannot be determined if a spike recovery is above the acceptance criterion in the MS and below the acceptance criterion in the MSD or vice versa. Therefore, the following procedures were used to verify parent sample data. The parent sample datum was not qualified if perchlorate was not detected in the parent sample. The parent sample datum was qualified with a “J” flag indicating the datum is estimated if perchlorate was detected in the parent sample.
- **Only the MS or MSD Outside Acceptance Criteria.** If perchlorate was outside acceptance criteria in only the MS or the MSD, the following criteria were used to evaluate the MS/MSD data. If a spike recovery in an MS or MSD sample was outside the acceptance criteria and the spike recovery in the other sample (MS or MSD) was just inside the acceptance criteria (at the same end of acceptance criteria range), the datum was

treated as if both the MS and MSD recoveries were outside the acceptance criteria. The parent sample datum was qualified using the criteria for MS/MSD recoveries above or below the acceptance limit as described previously. If an MS or MSD spike recovery was outside the acceptance criteria but the spike recovery in the other sample (MS or MSD) was well within the acceptance criteria (near the middle of the range), it was assumed that the recovery outside the acceptance criteria was anomalous, and not indicative of the sample media. Therefore, the parent sample datum was not qualified.

2.3.2.2. No sample data were qualified due to MS/MSD data outside acceptance criteria. Matrix spike/matrix spike duplicate data outside acceptance criteria that did not result in qualified data are presented in **Table 2** with “MS” and/or “MSD” as the QC type.

2.3.3 Laboratory Control Samples Evaluation

2.3.3.1. Laboratory control samples were analyzed to assess bias in the absence of matrix effects. Deionized water and sand were spiked with perchlorate according to the QAPP before analysis. The perchlorate percent recoveries were compared to the QAPP established QC limits. Laboratory control sample results are presented in **Table 8a** and **Table 8b**. The same criteria used to evaluate the MS/MSD samples described above were used to evaluate the LCS, except that all sample batch data associated with the LCS were qualified. No sample data were qualified due to LCS data outside acceptance criteria. Laboratory control sample data outside acceptance criteria that did not result in qualified data are presented in **Table 2** with “LCS” as the QC type.

2.4 PRECISION EVALUATION

2.4.0.1. Definition. Precision evaluation measures the reproducibility of measurements under a given set of conditions, and is expressed as RPD:

$$\text{RPD} = \left(\frac{|A - B|}{[A + B] / 2} \right) \times 100$$

Where: A and B = The reported concentrations for sample duplicate analyses.

2.4.0.2. Laboratory precision was evaluated using the RPDs between the MS/MSD samples, LD samples, and field duplicate samples. The following criteria were used to evaluate precision for MS/MSD and LD samples:

2.4.1 MS/MSD Evaluation

2.4.1.1. If the RPD exceeded the acceptance criterion, corresponding perchlorate detected in the parent sample was qualified with a “J” flag indicating the datum is estimated. Because bias cannot be determined for non-detect analytes, parent sample data for non-detect analytes were not qualified. Sample data that were qualified due to MS/MSD RPD data outside acceptance criteria are listed in **Table 1** with “RPD” as the QC type. Matrix spike/matrix spike duplicate RPD data outside acceptance criterion that did not result in qualified data are presented in **Table 2** with “RPD” as the QC type.

2.4.2 LD Evaluation

2.4.2.1. If the RPD exceeded the acceptance criterion, the perchlorate detected in the parent sample was qualified with a “J” flag indicating the datum is estimated. All LD RPD data were within the QC acceptance criterion.

2.4.2.2. The RPD was calculated only for those analytes that were detected above the MDL in both the environmental and LD samples. The LD data are presented in **Table 9a** and **Table 9b**.

2.4.3 Field Duplicate Sample Evaluation

2.4.3.1. As discussed previously, field duplicate samples were collected and analyzed to evaluate sampling and analytical precision. Because precision is affected by several variables including sample heterogeneity, sample collection procedures, and sample preparation and analysis, the results of field duplicates were used as additional evidence to support data quality rather than as a basis for data qualification. A comparison of the actual sample results and the RPDs indicate good agreement between the parent sample and its respective duplicate. The field duplicate data are presented in **Table 6**. Parent and field duplicate samples with an RPD greater than 20% or where perchlorate was detected in a field duplicate but not the parent sample, or vice versa, are listed in **Table 2** with “RPD” as the QC type.

2.5 COMPARABILITY EVALUATION

2.5.0.1. Comparability is a qualitative parameter that expresses the confidence that one data set may be compared to another data set. For this project, sample collection and analysis followed standard methods and the data were reported using standard units of measure. In addition, QC data for this project indicate the data are comparable. Therefore, the data from this project should be comparable to data collected at this site using similar sample collection and analytical methodology.

3.0 DATA VERIFICATION SUMMARY

3.0.0.1. Precision. Based on the results of the MS/MSD and LD sample evaluation, the sample data are precise as qualified.

3.0.0.2. Bias. Based on the results of the ICAL, CVS, LCS, and MS/MSD sample evaluation, the sample data are not biased as qualified.

3.0.0.3. Representativeness. Based on the results of the sample preservation and holding time evaluation, the method and equipment rinseate blank sample data, and field duplicate sample data evaluation, the sample data for this project were considered representative of the site as qualified.

3.0.0.4. Comparability. Standard methods of sample collection and standard units of measure were used during this project. The analyses performed by the laboratory were in accordance with current EPA/600R-93/100 methodology. The data collected during this program should be comparable to future data collected at this site using similar sample collection and analytical methodology.

3.0.0.5. Completeness. Based on the results of the data verification, all data were considered valid as qualified. Sampling completeness was 100 percent and analytical completeness was 100 percent.

4.0 DATA USABILITY ASSESSMENT

4.0.0.1. The data usability evaluation is a qualitative assessment that is conducted to evaluate whether the verified data are of sufficient quality to support the project objectives (i.e., end use). The objectives for this project were to evaluate the impact of perchlorate releases in the Bosque and Leon River Watersheds in support of site characterization.

4.0.0.2. The data usability evaluation was conducted by assessing the following:

- Were all data that were scheduled for this project collected?
- Did the water sample MDLs or RLs meet the intermediary Protective Concentration Level (PCL) of 4 micrograms per liter ($\mu\text{g/l}$) for perchlorate (i.e., will data that were collected support evaluation of presence or absence of contaminants below the PCLs?)
- Were data for this project “R”-flagged as potentially unusable? If so, will these data impact the decision making process (i.e., will these data affect conclusions regarding site characterization?)
- Did data that were qualified with a “UJ” flag as a possible false negative impact the decision making process (i.e., will these data affect conclusions regarding site characterization?)
- Was the data completeness goal of 95 percent for this project met (i.e., were sufficient data of sufficient quality collected to meet the project completeness goal?)

Based on the results of the data verification, the data collected for the Bosque and Leon river watersheds study are of sufficient quantity and quality to meet the project objectives. The remainder of this section presents the results of the data usability evaluation.

4.1 SAMPLE COLLECTION AND ANALYSIS COMPLETENESS

4.1.0.1. Sample Collection Completeness. All samples that were scheduled for this project were collected as specified in the QAPP, except for when a sample collection location was dry or when the automatic sample collection equipment malfunctioned. Also, samples scheduled to be collected on October 16, 2003, could not be collected because the automatic sample collection equipment was destroyed by flooding shortly after October 1, 2003. With these three exceptions excluded, sample collection completeness was 100 percent.

4.1.0.2. Sample Analysis Completeness. Analytical completeness was evaluated on a per analyte basis using the following equation:

$$\text{Completeness} = \frac{\text{Number of valid data points}}{\text{Total number of measurements}} \times 100$$

Where: The number of valid data points is the total number of valid analytical measurements based on the precision, bias, and holding time evaluation.

4.1.0.3. Based on the results of the data verification, all data are considered valid as qualified. Analytical completeness was 100 percent for all analytes, which meets the project completeness goal of 95 percent.

4.2 REPORTING LIMITS

4.2.0.1. For this project, every effort was made to analyze the samples using the best available method so that the PCLs for this project were met. The following criteria were used for data reporting:

- The intermediary PCL for perchlorate of 4 µg/l was equal to the laboratory RL. Therefore sample results were reported to the MDL. When perchlorate was not detected in a sample, perchlorate was reported as <MDL.
- If perchlorate was detected between the MDL and RL, the result was qualified with a “J” flag to indicate the data are estimated and reflect a value between the MDL and RL.

4.2.0.2. All non-detect results were less than the intermediary PCL.

4.3 “UJ” AND “R” QUALIFIED DATA

4.3.0.1. The two qualifiers that are of particular importance regarding data validation are “UJ”, which indicates a possible false negative and “R” which indicates the data may not be usable. No data were “R”-flagged for this project. The following paragraphs discuss the implications of “UJ” qualified data to data usability.

4.3.0.2. Sample data for non-detect compounds were qualified with a “UJ” flag to indicate the data are estimated as a potential false negative when QC criteria are outside the acceptance criteria indicating low bias. These data are summarized in **Table 1**. For the Bosque and Leon River Watersheds Study the “UJ” qualified data have no impact on data usability or the decisions that will be made regarding site characterization because the “UJ” qualified data are limited to IDW samples that were generated during decontamination of sampling equipment.

4.3.0.3. Perchlorate concentrations could not be determined in the IDW samples because Liqui-Nox[®], a commercially available detergent, was used to decontaminate the sampling equipment. Originally, very high concentrations of perchlorate were reported to be present in the IDW samples but not in the associated samples from which the IDW samples were generated. Therefore, a sample of pure Liqui-Nox[®] was analyzed to determine if the sample peaks, originally attributed to perchlorate, were actually due to media interference caused by the Liqui-Nox[®]. The USACE laboratory determined that Liqui-Nox[®] elution overlaps the retention time window of perchlorate causing media interference. Because perchlorate was not detected in the samples from which the IDW samples were generated, and the Liqui-Nox[®] caused media interference, the USACE laboratory reported the perchlorate concentrations for the IDW samples as less than the MDL with a comment that perchlorate concentrations could not be accurately determined due to media interference.

4.3.0.4. To verify that the sample peaks, originally attributed to perchlorate, were actually due to media interference caused by the Liqui-Nox[®], the groundwater IDW samples and a sample of pure Liqui-Nox[®] were submitted to Severn Trent Laboratories in Denver, Colorado, for analysis by liquid chromatograph/mass spectrometry/mass spectrometry (LC/MS/MS) method SW-846 8321A. This method was chosen to manage the interferences associated with Liqui-Nox[®] analysis. The LC/MS/MS analysis confirmed that the sample peaks, originally attributed to perchlorate, were in fact due to media interference caused by the Liqui-Nox[®], and that the groundwater IDW samples contained no perchlorate above the MDL.

BOSQUE AND LEON RIVER WATERSHEDS STUDY
(Page 2 of 2)

| Location Identification | Sample Identification | Sample Date | Analysis | Analyte | Sample Result | Sample Units | QC Type | QC Result | QC Units | Qualifier | Bias | Comment |
|-------------------------|-----------------------|-------------|----------------|-------------|---------------|--------------|---------|-----------|----------|-----------|------|--|
| Liqui-Nox | Liqui-Nox | 06/20/03 | U.S. EPA 314.0 | Perchlorate | <1 | µg/l | INT | -- | -- | UJ | Low | Possible false negative. Perchlorate concentration could not be determined due to interfering Liqui-Nox (surfactant) peak. |
| SBR1 | SBR1-SW-09-25-0701 | 09/25/03 | U.S. EPA 314.0 | Perchlorate | 1 J | µg/l | CVS | 118 | % | J | High | Datum is estimated, possible high bias. Calibration verification standard percent recovery outside acceptance criteria. |
| SC3 | SC3-SW-05-02-1504 | 05/02/03 | U.S. EPA 314.0 | Perchlorate | 7.2 | µg/l | RPD | 29.5 | % | J | None | Datum is estimated, bias unknown. Matrix spike/matrix spike duplicate RPD outside acceptance criterion. |
| SC3 | SC3-SW-05-09-1104 | 05/09/03 | U.S. EPA 314.0 | Perchlorate | 1 J | µg/l | RPD | 24.9 | % | J | None | Datum is estimated, bias unknown. Matrix spike/matrix spike duplicate RPD outside acceptance criterion. |

Non-detect sample data are reported to the method detection limit.

µg/l micrograms per liter.

-- Not applicable.

CVS Calibration verification standard.

HT Holding time.

INT Interference.

J Data are estimated due to associated quality control data; and/or the analyte was positively identified but the reported concentration is estimated - reported concentration is less than the reporting limit, but greater than the method detection limit.

QC Quality control.

RPD Relative percent difference.

| WG14199-1 | 12/31/2003 | <1 | µg/l |
| WG14200-1 | 12/31/2003 | <1 | µg/l |

Non-detect sample data are reported to the method detection limit.
µg/l micrograms per liter.

TABLE 4b

**SOIL METHOD BLANK DATA SUMMARY
BOSQUE AND LEON RIVER WATERSHEDS STUDY
(Page 1 of 1)**

| Laboratory Identification | Analysis Date | Perchlorate Result | Units |
|--------------------------------------|--------------------------|-------------------------------|--------------|
| WG11801-1 | 11/29/2002 | <10 | µg/kg |

Non-detect sample data are reported to the method detection limit.
µg/kg micrograms per kilogram.

TABLE 5

**EQUIPMENT RINSEATE BLANK DATA SUMMARY
BOSQUE AND LEON RIVER WATERSHEDS STUDY

Non-detect sample data are reported to the method detection limit.

Bold Bolded result indicates positively identified compound.

-- Not applicable.

NC Not calculated.

J Data are estimated due to associated quality control data; and/or the analyte was positively identified but the reported concentration is estimated - reported concentration is less than the reporting limit, but greater than the method detection limit .

RPD Relative percent difference

Non-detect sample data are reported to the method detection limit.

$\mu\text{g/l}$ micrograms per liter.

Bold Bolded result indicates positively identified compound.

Shading Shading indicates that the result is outside acceptance criteria.

J Data are estimated due to associated quality control data; and/or the analyte was positively identified but the reported concentration is estimated - reported concentration is less than the reporting limit, but greater than the method detection limit .

MS Matrix spike sample.

MSD Matrix spike duplicate sample.

RPD Relative percent difference

| WF | WF-SW-06-20-0855 | 06/20/2003 | 0855 | 15 | <1 | <1 | NC |
| WF | WF-SW-12-15-0824 | 12/15/2003 | 0824 | 15 | <1 | <1 | NC |

Non-detect sample data are reported to the method detection limit.

Bold Bolded result indicates positively identified compound.

NC Not calculated.

J Data are estimated due to associated quality control data; and/or the analyte was positively identified but the reported concentration is estimated - reported concentration is less than the reporting limit, but greater than the method detection limit .

RPD Relative percent difference

TABLE 9b
LABORATORY DUPLICATE SOIL DATA SUMMARY
BOSQUE AND LEON RIVER WATERSHEDS STUDY
(Page 1 of 1)

| Location Identification | Field Identification | Collection Date | Collection Time | Parent Result | Duplicate Result | RPD |
|--------------------------------|-----------------------------|------------------------|------------------------|----------------------|-------------------------|------------|
| SBR3 | SBR3-IDW-Composite | 11/26/2002 | 1525 | <13 | <11 | NC |

Non-detect sample data are reported to the method detection limit.

NC Not calculated.
